

# Generating evidence to support a Urea-based emollient for diabetic foot care

## Problem

Limited clinical data supporting use  
Acquisition cost a barrier

## Current behaviour

Primary care choose simple, non urea-based emollient

## Expert opinion (podiatry, diabetology, dermatology)

Urea-based emollient is more effective than simple emollient

## Consensus achieved

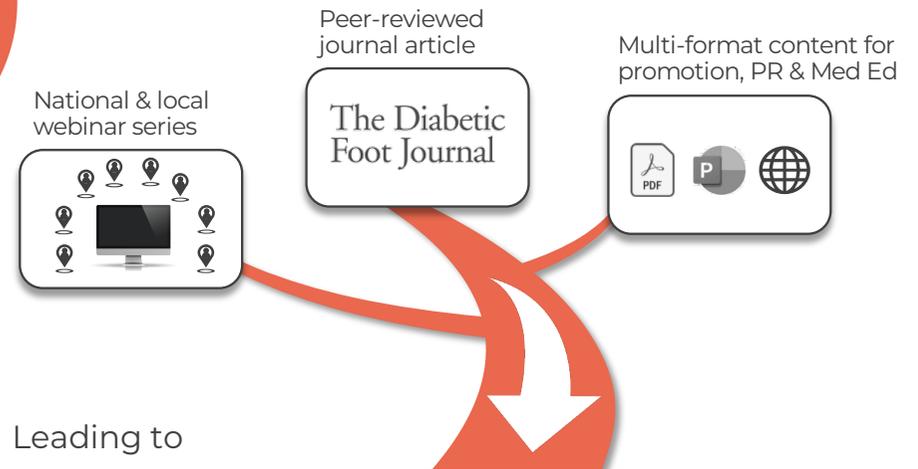

232 responses

10 recommendations

*"People with diabetes and either peripheral neuropathy or peripheral arterial disease should have a daily application of urea-based emollient, initiated as early as possible"*

## Implementation plan

Leading to

Revitalised medical & promotional engagement
